

Application Scenarios

Interface Management

Interface Management

A complete Solution instead of Interface Chaos

With the success of a company, the number and variety of EDI interfaces often grows. Over time, several software products, complicated filing systems and specialized knowledge have often been distributed decentrally within the company. The effort and thus the costs of interface administration rise steeply.

GEFEG.FX creates Order and Tidies Up!

GEFEG.FX combines all interfaces and typical requirements such as maintenance, development, documentation and validation in a uniform and consistent environment. Expertise, workflows and data governance are concentrated in one place. This unites the users and thus releases considerable cost saving potentials.

Innovative and integrative Software Solution

GEFEG.FX is independent of the EDI system architecture (EDI syntax, ERP system, converter, middleware) and therefore becomes the central interface hub. Innovative concepts, such as the Guideline technology, enable business users to feed the interface descriptions (specifications) from a content, business and legal perspective and publish business-friendly results. Supported by collaborative communication and storage (SVN, GIT), but also

technical users can access the interface descriptions and add their share and generate relevant technical output.
